Trent Vale Infant and Nursery School and Beeston Rylands Junior School

Calculation Policy for Multiplication and Division Year 1 to Year 6

Bar Model

Children can use the single bar model to represent multiplication as repeated addition. They could use counters, cubes or dots within the bar model to support calculation before moving on to placing digits into the bar model to represent the multiplication.

Division can be represented by showing the total of the bar model and then dividing the bar model into equal groups.

It is important when solving word problems that the bar model represents the problem.

Sometimes, children may look at scaling problems. In this case, more than one bar model is useful to represent this type of problem, e.g. There are 3 girls in a group. There are 5 times more boys than girls. How many boys are there?

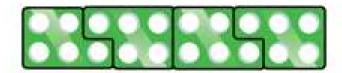

The multiple bar model provides an opportunity to compare the groups.

Number Shapes

$$5 \times 4 = 20$$

 $4 \times 5 = 20$

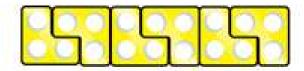

$$5 \times 4 = 20$$

$$4 \times 5 = 20$$

$$18 \div 3 = 6$$

Number shapes support children's understanding of multiplication as repeated addition.

Children can build multiplications in a row using the number shapes. When using odd numbers, encourage children to interlock the shapes so there are no gaps in the row. They can then use the tens number shapes along with other necessary shapes over the top of the row to check the total. Using the number shapes in multiplication can support children in discovering patterns of multiplication e.g. odd × odd = even, odd × even = odd, even × even = even.

When dividing, number shapes support children's understanding of division as grouping. Children make the number they are dividing and then place the number shape they are dividing by over the top of the number to find how many groups of the number there are altogether e.g. There are 6 groups of 3 in 18.

Bead Strings

$$5 \times 3 = 15$$

 $3 \times 5 = 15$
 $15 \div 3 = 5$

$$5 \times 3 = 15$$

 $3 \times 5 = 15$ $15 \div 5 = 3$

$$4 \times 5 = 20$$

 $5 \times 4 = 20$ $20 \div 4 = 5$

Bead strings to 100 can support children in their understanding of multiplication as repeated addition. Children can build the multiplication using the beads. The colour of beads supports children in seeing how many groups of 10 they have, to calculate the total more efficiently.

Encourage children to count in multiples as they build the number e.g. 4, 8, 12, 16, 20.

Children can also use the bead string to count forwards and backwards in multiples, moving the beads as they count.

When dividing, children build the number they are dividing and then group the beads into the number they are dividing by e.g. 20 divided by 4 – Make 20 and then group the beads into groups of four. Count how many groups you have made to find the answer.

Number Tracks

$$6 \times 3 = 18$$

$$3 \times 6 = 18$$

$$18 \div 3 = 6$$

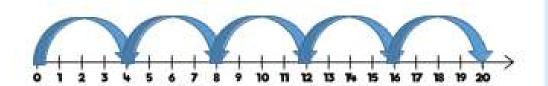

Number tracks are useful to support children to count in multiples, forwards and backwards. Moving counters or cubes along the number track can support children to keep track of their counting. Translucent counters help children to see the number they have landed on whilst counting.

When multiplying, children place their counter on 0 to start and then count on to find the product of the numbers.

When dividing, children place their counter on the number they are dividing and the count back in jumps of the number they are dividing by until they reach 0. Children record how many jumps they have made to find the answer to the division.

Number tracks can be useful with smaller multiples but when reaching larger numbers they can become less efficient.

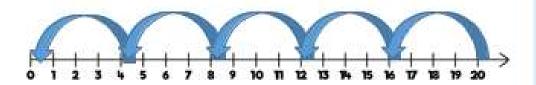

Number Lines (labelled)

$$4 \times 5 = 20$$

 $5 \times 4 = 20$

$$20 \div 4 = 5$$

Labelled number lines are useful to support children to count in multiples, forwards and backwards as well as calculating single-digit multiplications.

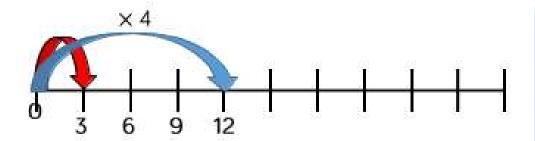

When multiplying, children start at 0 and then count on to find the product of the numbers.

When dividing, start at the number they are dividing and the count back in jumps of the number they are dividing by until they reach O.

Children record how many jumps they have made to find the answer to the division.

Labelled number lines can be useful with smaller multiples, however they become inefficient as numbers become larger due to the required size of the number line.

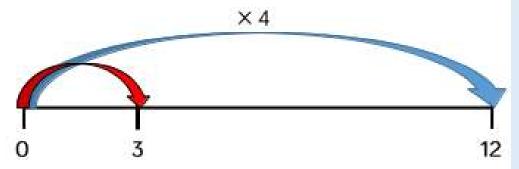

Number Lines (blank)

A red car travels 3 miles.

A blue car 4 times further.

How far does the blue car travel?

A blue car travels 12 miles.

A red car 4 times less.

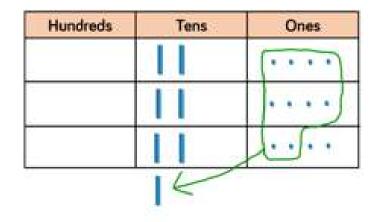

How far does the red car travel?

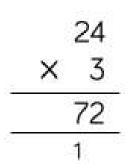

Children can use blank number lines to represent scaling as multiplication or division.

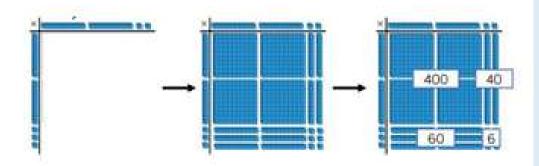

Blank number lines with intervals can support children to represent scaling accurately. Children can label intervals with multiples to calculate scaling problems.

Blank number lines without intervals can also be used for children to represent scaling.

Base 10/Dienes (multiplication)

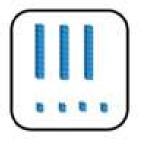

Using Base 10 or Dienes is an effective way to support children's understanding of column multiplication. It is important that children write out their calculation alongside the equipment so they can see how the concrete and written representations match.

As numbers become larger in multiplication or the amounts of groups becomes higher, Base 10 / Dienes becomes less efficient due to the amount of equipment and number of exchanges needed.

Base 10 also supports the area model of multiplication well. Children use the equipment to build the number in a rectangular shape which they then find the area of by calculating the total value of the pieces This area model can be linked to the grid method or the formal column method of multiplying 2-digits by 2-digits.

Base 10/Dienes (division)

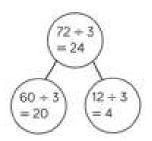

$$68 \div 2 = 34$$

Tens	Ones
11	
11	
11	3 1 2 2

$$72 \div 3 = 24$$

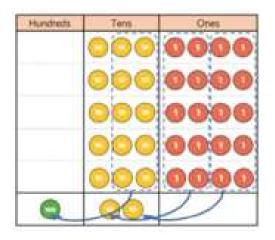

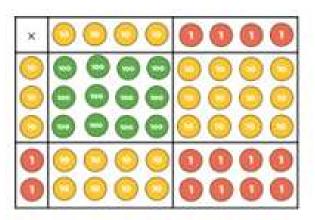

Using Base 10 or Dienes is an effective way to support children's understanding of division.

When numbers become larger, it can be an effective way to move children from representing numbers as ones towards representing them as tens and ones in order to divide. Children can then share the Base 10/ Dienes between different groups e.g. by drawing circles or by rows on a place value grid.

When they are sharing, children start with the larger place value and work from left to right. If there are any left in a column, they exchange e.g. one ten for ten ones. When recording, encourage children to use the part-whole model so they can consider how the number has been partitioned in order to divide. This will support them with mental methods.

Place Value Counters (multiplication)

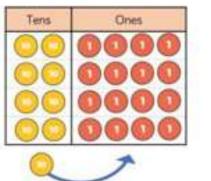

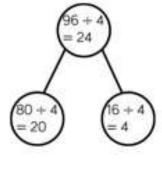

Using place value counters is an effective way to support children's understanding of column multiplication. It is important that children write out their calculation alongside the equipment so they can see how the concrete and written match.

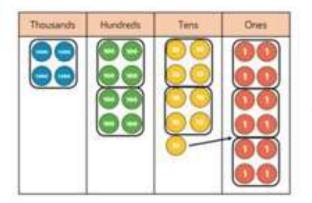

As numbers become larger in multiplication or the amounts of groups becomes higher, Base 10 / Dienes becomes less efficient due to the amount of equipment and number of exchanges needed The counters should be used to support the understanding of the written method rather than support the arithmetic.

Place value counters also support the area model of multiplication well. Children can see how to multiply 2digit numbers by 2-digit numbers.

Place Value Counters (division)

1223 4 489²2 Using place value counters is an effective way to support children's understanding of division.

When working with smaller numbers, children can use place value counters to share between groups. They start by sharing the larger place value column and work from left to right. If there are any counters left over once they have been shared, they exchange the counter e.g. exchange one ten for ten ones. This method can be linked to the part-whole model to support children to show their thinking.

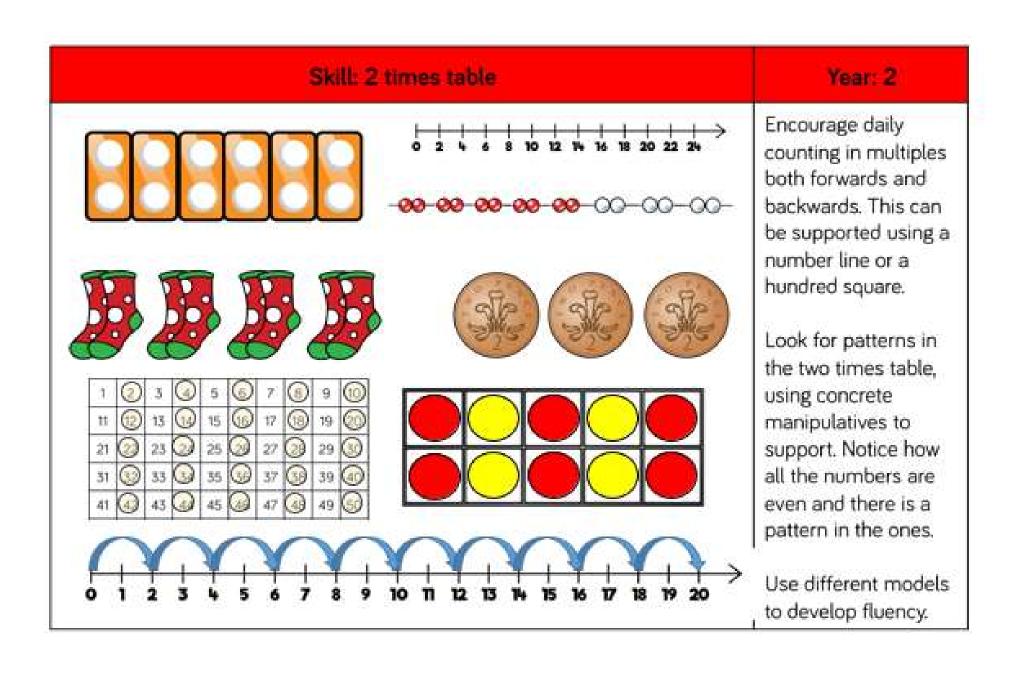

Place value counters also support children's understanding of short division by grouping the counters rather than sharing them. Children work from left to right through the place value columns and group the counters in the number they are dividing by. If there are any counters left over after they have been grouped, they exchange the counter e.g. exchange one hundred for ten tens.

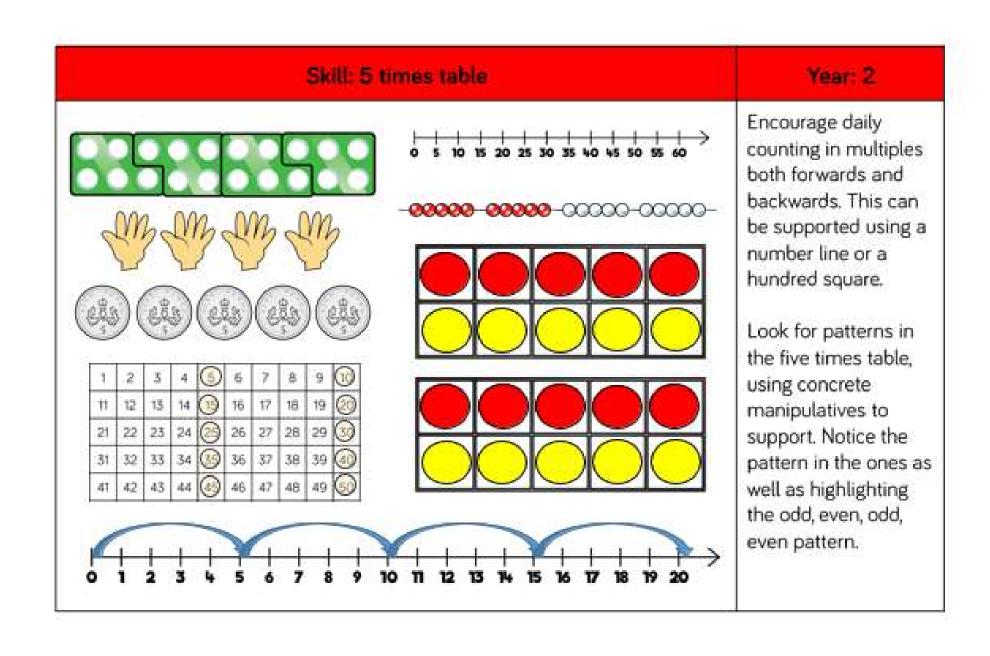

Times Tables

Skill	Year	Representations and models				
Recall and use multiplication and division facts for the 2-times table		Bar model Number shapes Counters Money	Ten frames Bead strings Number lines Everyday objects

81	82	83	84	85	86	87	88	89	9
91	92	93	94	95	96	97	98	99	0

Encourage daily counting in multiples both forwards and backwards. This can be supported using a number line or a hundred square.

Year: 2

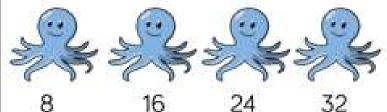

Look for patterns in the ten times table, using concrete manipulatives to support. Notice the pattern in the digitsthe ones are always O, and the tens increase by 1 ten each time.

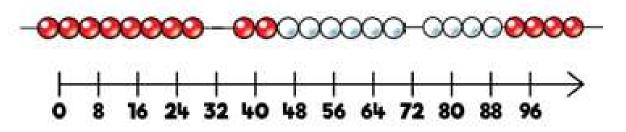

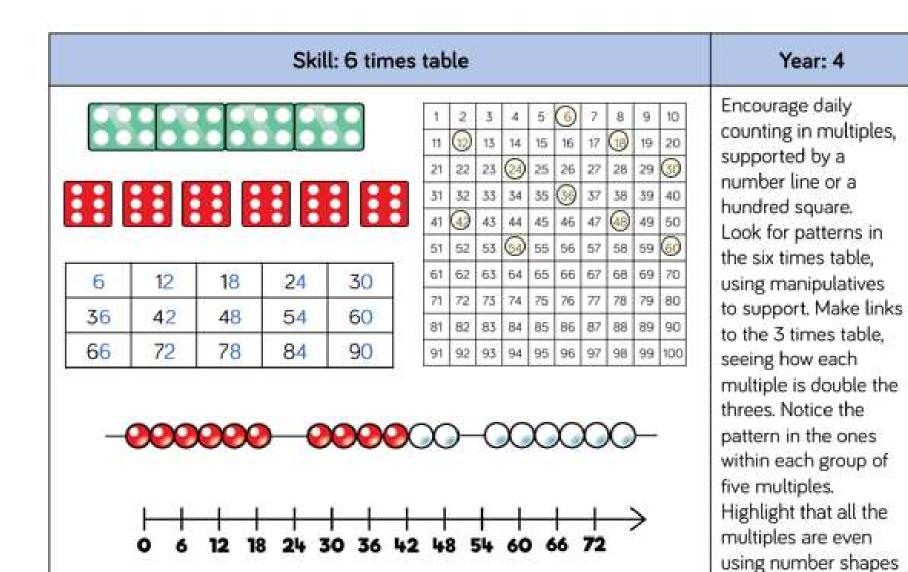

I	8	16	24	32	40
ĺ	48	56	64	72	80

1	2	3	4	5	6	7	(8)	9	10

61	62	63	(3)	65	66	67	68	69	70
71	1	73	74	75	76	77	78	79	(1)
81	82	83	84	85	86	87	88	89	90
91	92	93	94	95	96	97	98	99	100

Encourage daily counting in multiples, supported by a number line or a hundred square. Look for patterns in the eight times table, using manipulatives to support. Make links to the 4 times table, seeing how each multiple is double the fours. Notice the pattern in the ones within each group of five multiples. Highlight that all the multiples are even using number shapes to support.

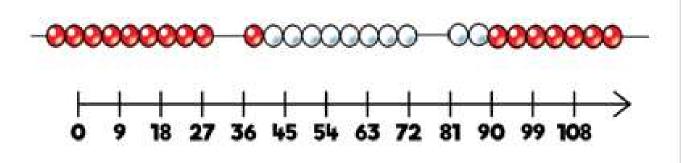

to support.

Skill: 9 times table

9	18	27	36	45
54	63	72	81	90

(8)	82	83	84	85	86	87	88	89	9
91	92	93	94	95	96	97	98.	9	100

Year: 4

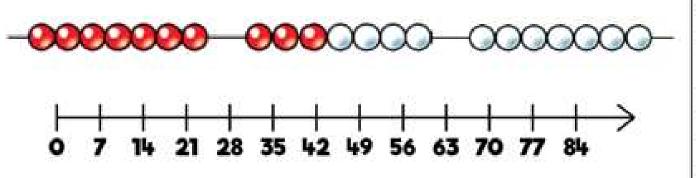

Encourage daily counting in multiples both forwards and backwards. This can be supported using a number line or a hundred square. Look for patterns in the nine times table, using concrete manipulatives to support. Notice the pattern in the tens and ones using the hundred square to support as well as noting the odd, even pattern within the multiples.

Skill: 7 times table

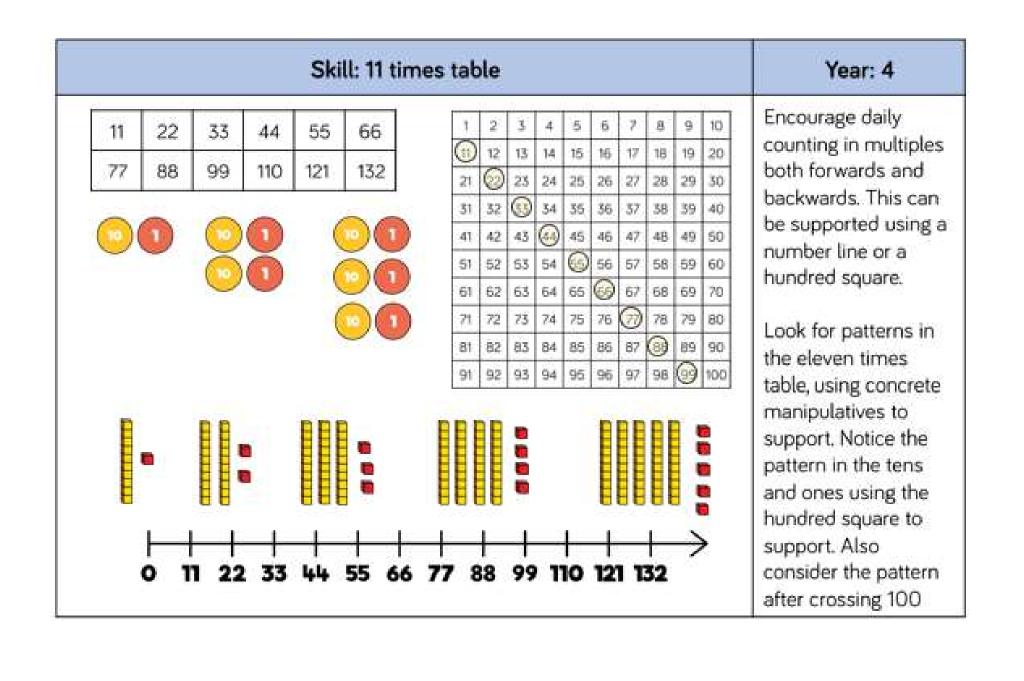

7	14	21	28	35
42	49	56	63	70

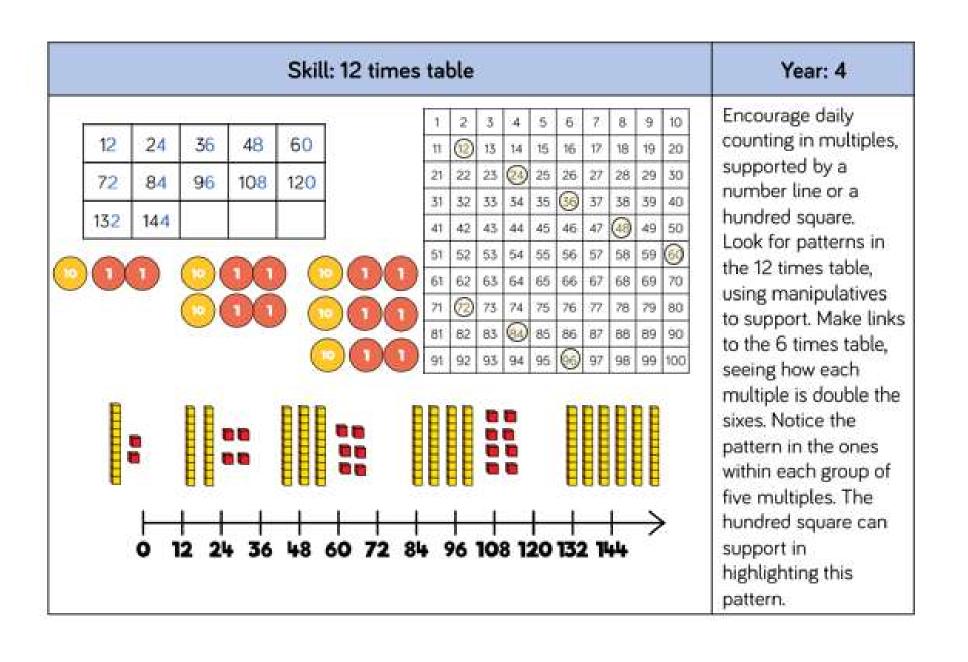

1	2	3	4	5	6	(3)	8	9	10
11	12	13.	(1)	15	16	17	18	19	20
1	22	23	24	25	26	27	(3)	29	30
31	32	33	34	(3)	36	37	38	39	40
41	0	43	44	45	46	47	48	(1)	50
51	52	53	54	55	(3)	57	58	59	60
61	62	6	64	65	66	67	68	69	3
71	72	73	74	75	76	\bigcirc	7.8	79	80
81	82	83	(9)	85	86	87	88	89	90
9)	92	93	94	95	96	97	9	99	100

Year: 4

Encourage daily counting in multiples both forwards and backwards, supported by a number line or a hundred square. The seven times table can be trickier to learn due to the lack of obvious pattern in the numbers, however they already know several facts due to commutativity. Children can still see the odd, even pattern in the multiples using number shapes to support.

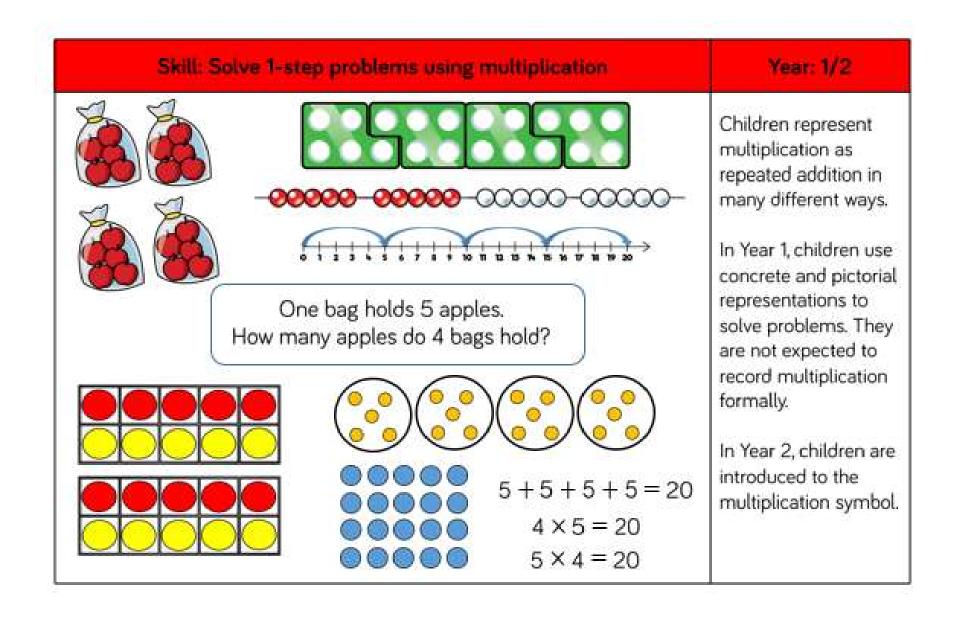

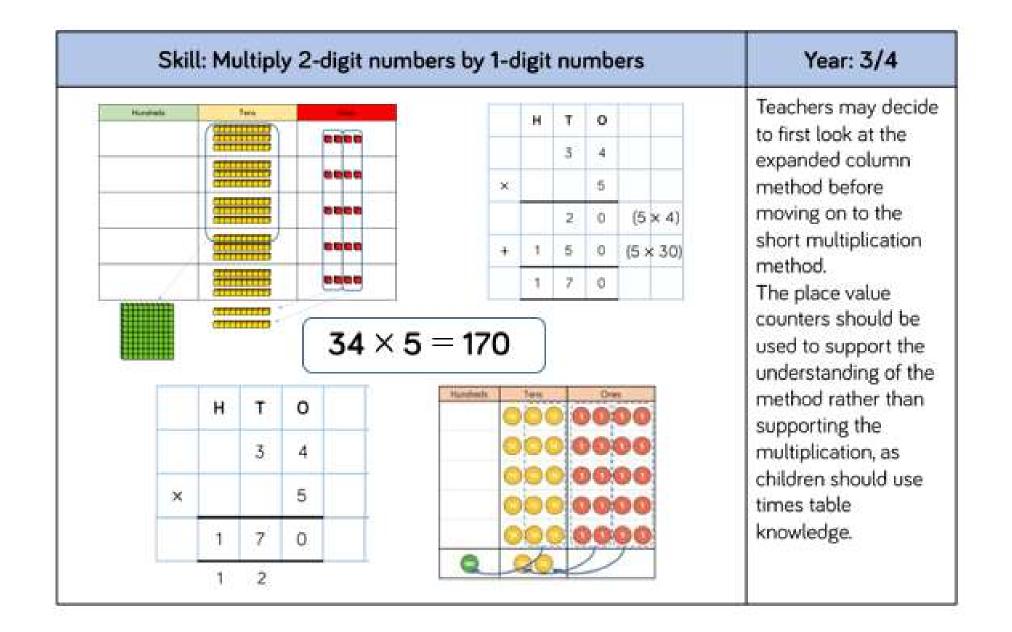

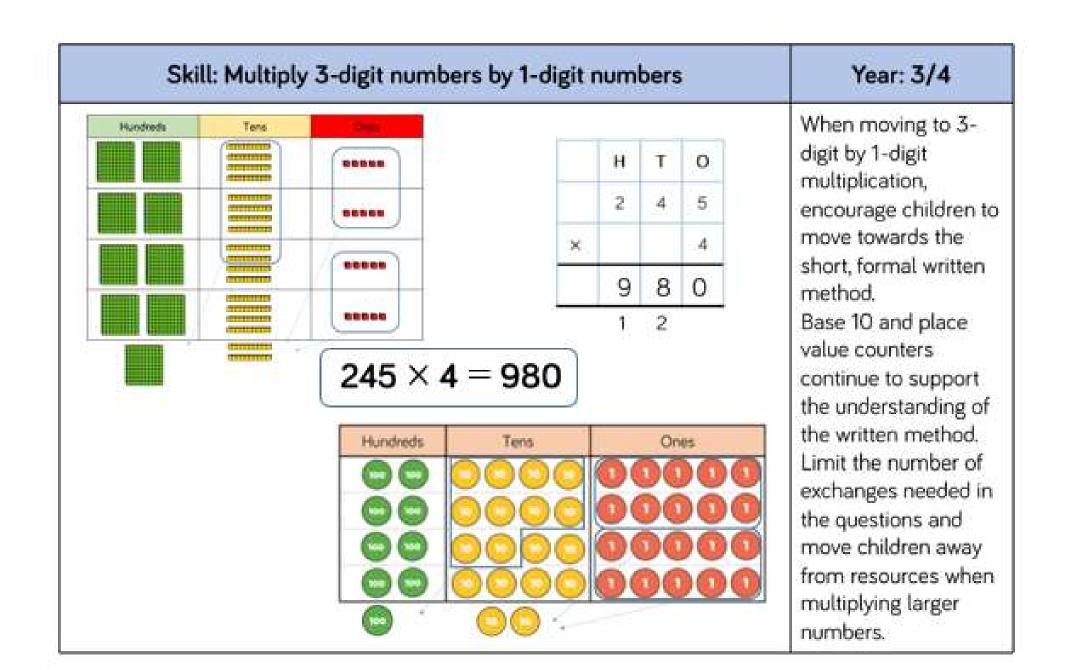

Multiplication

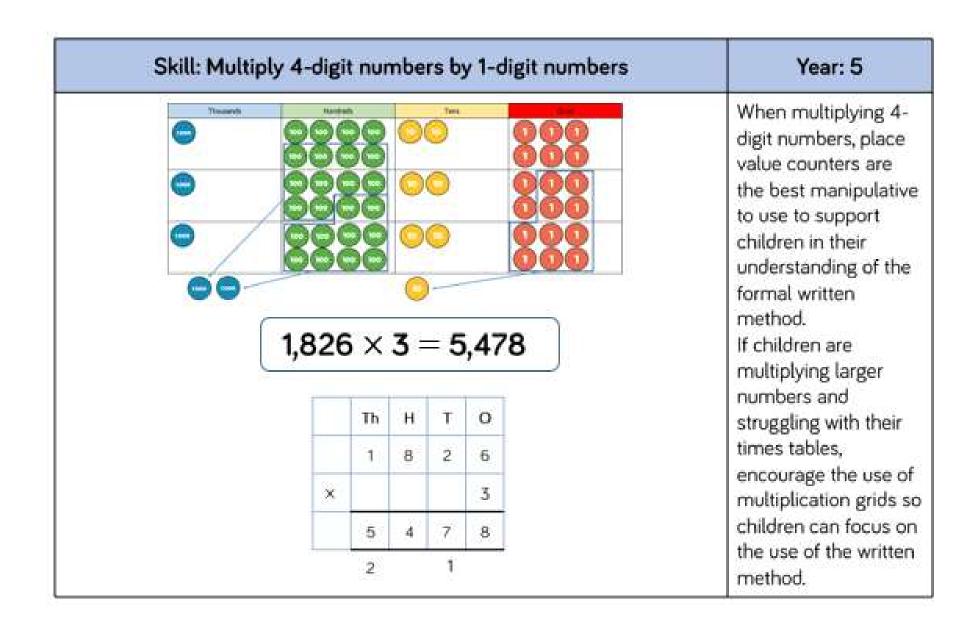

Skill	Year	fear Representations and models				
Solve one-step problems with multiplication	1/2	Bar model Number shapes Counters	Ten frames Bead strings Number lines

Skill: Divide 2-digits by 1-digit (sharing with no exchange)

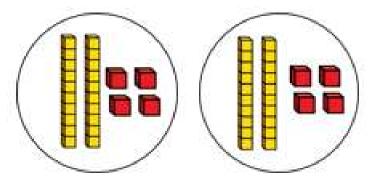

Tens Ones Ones Ones

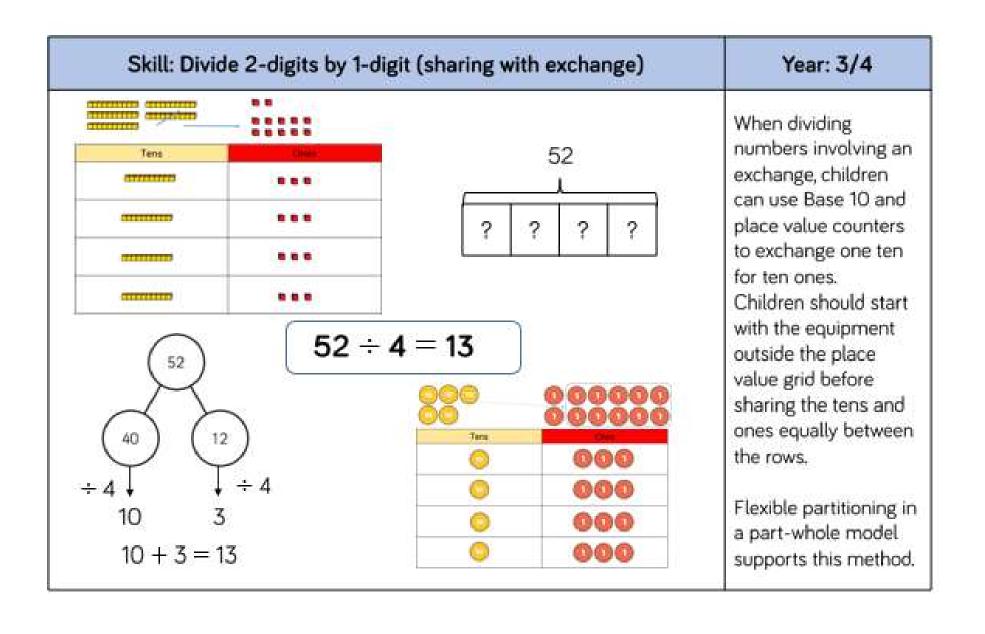

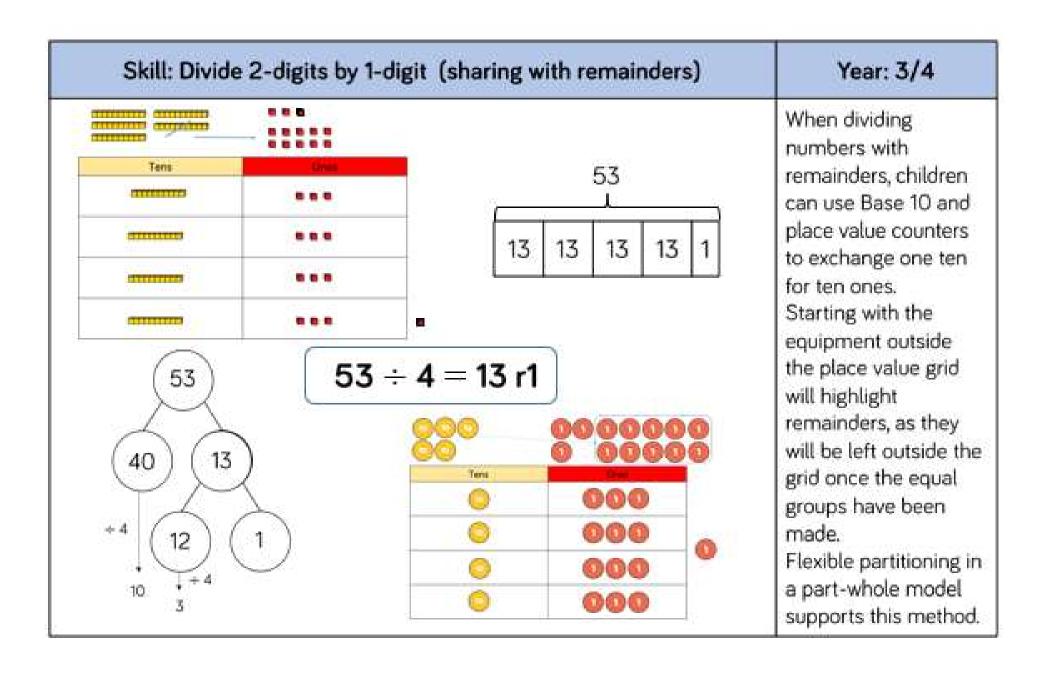

Year: 1/2

When dividing larger numbers, children can use manipulatives that allow them to partition into tens and ones.

Straws, Base 10 and place value counters can all be used to share numbers into equal groups.

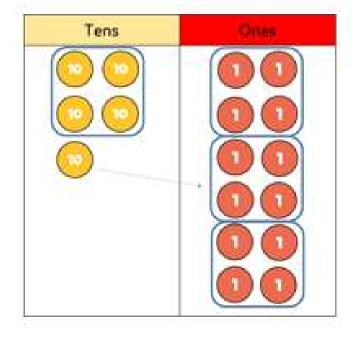

Part-whole models can provide children with a clear written method that matches the concrete representation.

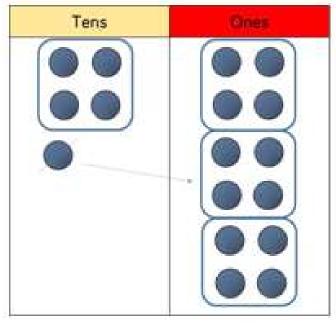

Skill: Divide 2-digits by 1-digit (grouping)

When using the short division method, children use grouping. Starting with the largest place value, they group by the divisor.

Language is important here. Children should consider 'How many groups of 4 tens can we make?' and 'How many groups of 4 ones can we make?'

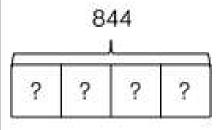

Remainders can also be seen as they are left ungrouped.

 $52 \div 4 = 13$

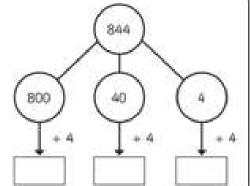

Skill: Divide 3-digits by 1-digit (sharing)

Year: 4

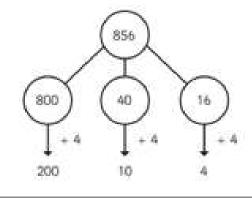

844	÷ 4	. = 1	22
-----	-----	-------	----

Н	1	0
00	0	0
00	0	0
00	0	0
	0	0

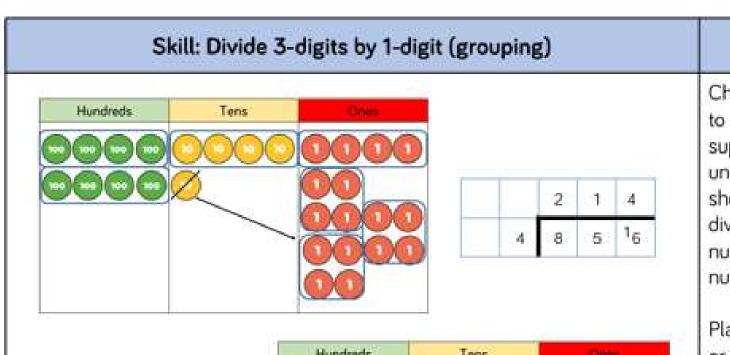

Children can continue to use place value counters to share 3digit numbers into equal groups. Children should start with the equipment outside the place value grid before sharing the hundreds, tens and ones equally between the rows. This method can also help to highlight remainders. Flexible partitioning in a part-whole model supports this method.

 $856 \div 4 = 214$

Hundreds Tens Ones

Children can continue to use grouping to support their understanding of short division when dividing a 3-digit number by a 1-digit number.

Year: 5

Place value counters or plain counters can be used on a place value grid to support this understanding. Children can also draw their own counters and group them through a more pictorial method.

Skill: Divide 4-digits by 1-digit (grouping)

	4	2	6	6
1	0	-21	1,	10

Place value counters or plain counters can be used on a place value grid to support children to divide 4-digits by 1-digit.
Children can also draw their own counters and group them through a more pictorial method.

Year: 5

Children should be encouraged to move away from the concrete and pictorial when dividing numbers with multiple exchanges.

$$8,532 \div 2 = 4,266$$

	Skill: Divide multi-digits by 2-digits (long division)												Year: 6	
1	2 -	0 4 3	3 6 7	6 2 0 2 2	12 × 1 = 12 12 × 2 = 24 (×30) 12 × 3 = 36 12 × 4 = 48 12 × 5 = 60 12 × 6 = 72 12 × 7 = 84 12 × 8 = 96 12 × 7 = 108 12 × 10 = 120			43	32		12 =	= 36	Children can also divide by 2-digit numbers using long division. Children can write our multiples to support their calculations with larger remainders.	
							0	4	В	9		400480-480	OLOGO DE LOS COMOS	
						15	7	3	3	5		1 × 15 = 15	Children will also	
							6	0	0	0	(x400	$2 \times 15 = 30$	solve problems with	
-	73	35	;	- 1	5 = 489		1	3	3	5		$3 \times 15 = 45$	remainders where the	
				100	- 100	=	1	2	0	0	(×80)	$4 \times 15 = 60$	quotient can be	
								1	3	5		$5 \times 15 = 75$	rounded as	
						-		1	3	5	(x9)	$10 \times 15 = 150$	appropriate.	
										0.				

Skill: Divide multi digits by 2-digits (long division)

Year: 6

 $372 \div 15 = 24 \text{ r} 12$

			2	4	ř	1	2
1	5	3	7	2			
	_	3	0	0			
			7	2			
	-		6	0			
			1	2			

$$1 \times 15 = 15$$

 $2 \times 15 = 30$
 $3 \times 15 = 45$
 $4 \times 15 = 60$
 $5 \times 15 = 75$
 $10 \times 15 = 150$

When a remainder is left at the end of a calculation, children can either leave it as a remainder or convert it to a fraction.
This will depend on the context of the question.

$$372 \div 15 = 24 \frac{4}{5}$$

Children can also answer questions where the quotient needs to be rounded according to the context.
